

Properties of the Higgs Boson (Status Summer 2014)

Roger Wolf
24. June 2014

INSTITUTE OF EXPERIMENTAL PARTICLE PHYSICS (IEKP) – PHYSICS FACULTY

Higgs Boson Production & Decay

If m_H is given all properties of the (SM) Higgs boson are known:

Gluon fusion

Vector boson fusion

Associated production

Production (in proton proton collisions)

Decay

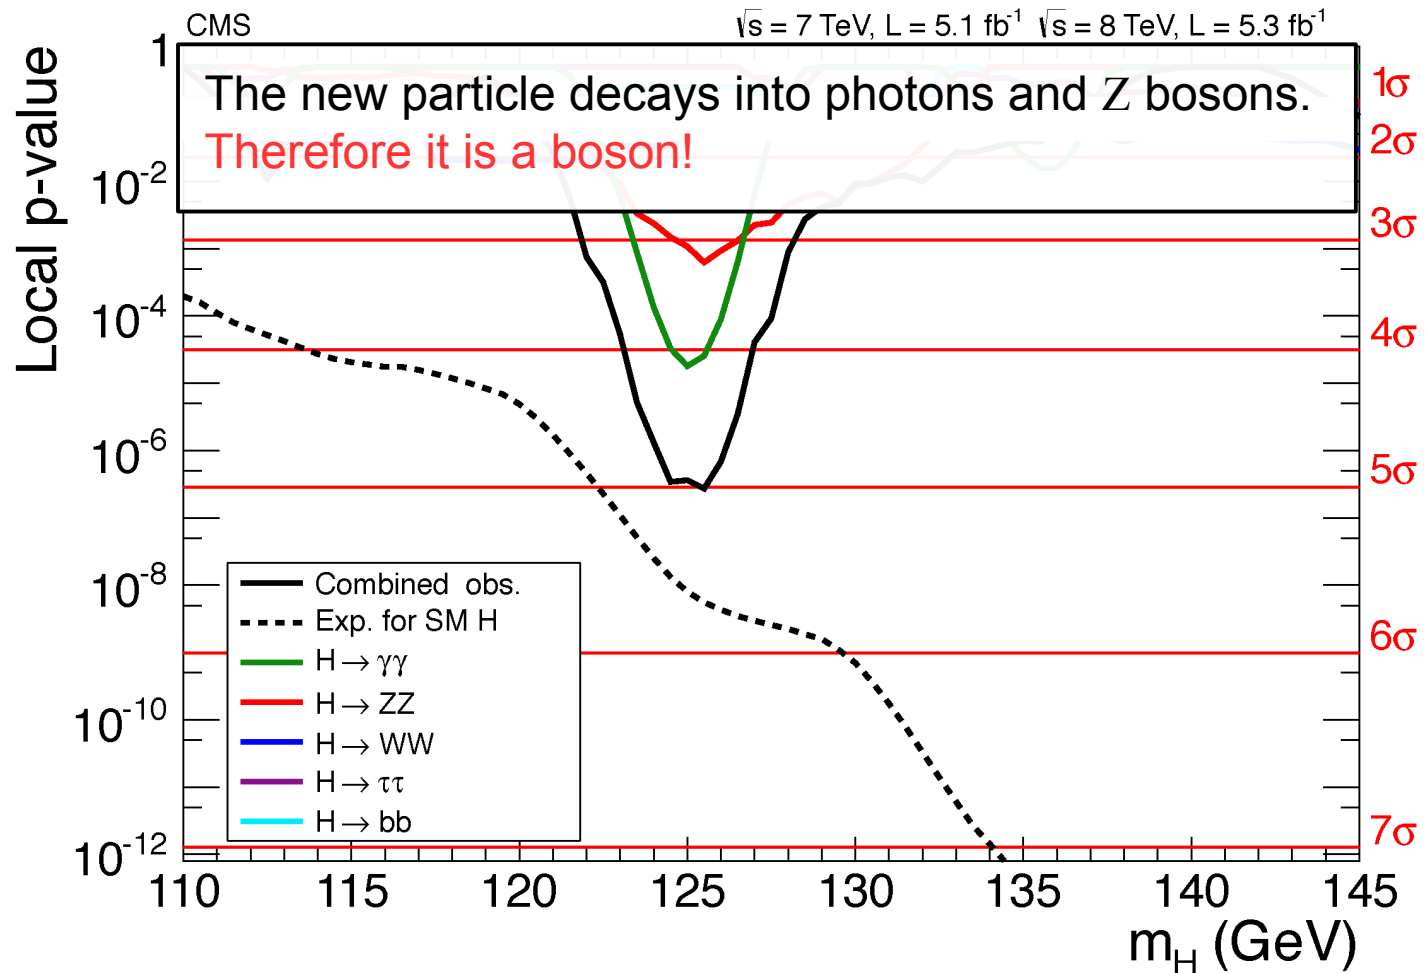

Reminder: Discovery on 4th July 2012

- Scratching magic 5σ boundary.
- Discovery driven by $H \rightarrow \gamma\gamma$ and $H \rightarrow ZZ$ (high resolution channels).
- Broad moderate excesses for $H \rightarrow WW$ and $H \rightarrow bb$.
- No signal seen in $H \rightarrow \tau\tau$.

Reminder: Discovery on 4th July 2012

- Scratching magic 5σ boundary.
- Discovery driven by $H \rightarrow \gamma\gamma$ and $H \rightarrow ZZ$ (high resolution channels).
- Broad moderate excesses for $H \rightarrow WW$ and $H \rightarrow bb$.
- No signal seen in $H \rightarrow \tau\tau$.

- Mass
- Decay Width
- Signal Strength
- Couplings
- Spin and CP

Analyzed Datasets

- Status: Summer 2014.
- Final states:
 - $H \rightarrow \gamma\gamma$ $H \rightarrow bb$
 - $H \rightarrow ZZ$ $H \rightarrow \tau\tau$
 - $H \rightarrow WW$
- Production modes:
 - $gg \rightarrow H$ $qq \rightarrow VH$
 - $qq \rightarrow qqH$ $gg \rightarrow ttH$
- 207 event categories.
- 2519 nuisance parameters.
- ~20 MB binary file of statistic model, ~50 MB human readable *txt* file.

| Decay tag and production tag | Expected signal composition | $\sigma_{\text{sig}}/m_{\text{H}}$ | Luminosity (fb^{-1}) | | |

[†] Events fulfilling the requirements of either selection are combined into one category.

[‡] Values for analyses dedicated to the measurement of the mass that do not use the same categories and/or observables.

^{*} Composition in the regions for which the ratio between signal and background $s/(s+b) > 0.05$.

Mass Measurement

- Only “free parameter” in the SM.
- Can be directly measured in high resolution channels ($H \rightarrow \gamma\gamma$, $H \rightarrow ZZ$).

Mass: Best Estimate

- Four free parameters in fit: m_H (POI), μ_{ZZ} , $\mu_{\gamma\gamma} (ggH, ttH)$, $\mu_{\gamma\gamma} (qqH, VH)$ (profiled)

- Best estimate: $m_H = 125.03 \pm_{0.27}^{0.26} \text{ (stat.)} \pm_{0.15}^{0.13} \text{ (syst.) GeV}$

- Cannot be measured directly from mass peak (**experimental resolution**).
- But **accessible in $H \rightarrow ZZ$ via line shape analysis** of (non-)resonant $gg \rightarrow ZZ, H \rightarrow 4\ell$ production:

$$\frac{d\sigma(gg \rightarrow H \rightarrow ZZ)}{dm_{4\ell}^2} \propto \frac{\kappa_g^2 \kappa_Z^2}{(m_{4\ell}^2 - m_H^2)^2 + m_H^2 \Gamma_H^2}$$

$$\sigma^{\text{on-shell}} \propto \frac{\kappa_{ggH}^2 \kappa_{HZZ}^2}{m_H \Gamma_H} \Big|_{m_{4\ell} \approx m_H}$$

$$\sigma^{\text{off-shell}} \propto \frac{\kappa_{ggH}^2 \kappa_{HZZ}^2}{(m_{4\ell})^2} \Big|_{m_{4\ell} \approx 2m_Z}$$

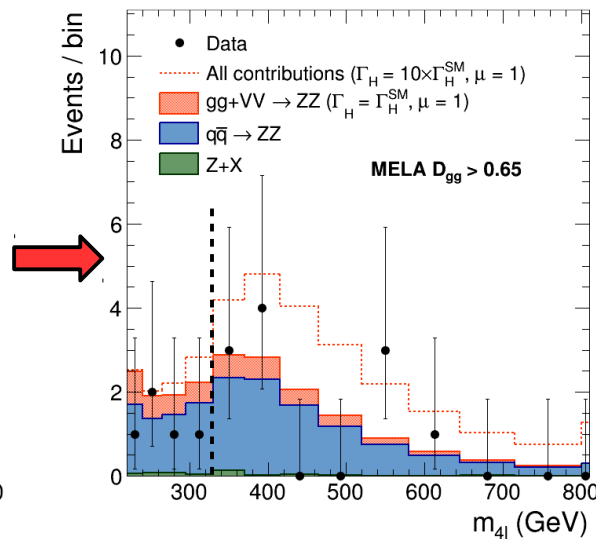

- **Off-shell cross sections enhanced** close to ZZ production threshold.

- Best estimate: $m_H = 125.03 \pm_{0.27}^{0.26} \text{ (stat.)} \pm_{0.15}^{0.13} \text{ (syst.) GeV}$

Decay Width

- Count ratio of **off-shell over on-shell** events.
- Use 4ℓ (on- and off-shell) & $2\ell 2\nu$ (off-shell only).
- **95% CL upper limit $\Gamma_H < 22 \text{ MeV}$ (obs), 33 MeV (exp).**

Compatibility of Couplings the SM

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 8 | | | 4 | | 6 | | | 7 |
| | | | | | | 4 | | |
| | 1 | | | | | 6 | 5 | |
| 5 | | 9 | | 3 | | 7 | 8 | |
| | | | | 7 | | | | |
| | 4 | 8 | | 2 | | 1 | | 3 |
| | 5 | 2 | | | | | 9 | |
| | | 1 | | | | | | |
| 3 | | | 9 | | 2 | | | 5 |

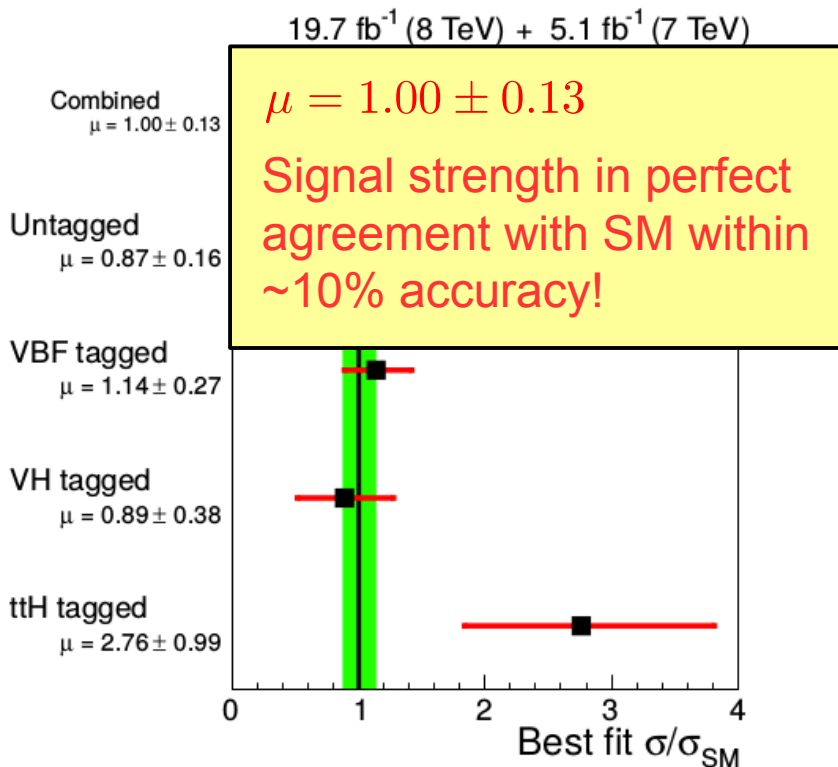

Compatibility of Couplings the SM

- **Fix mass to best fit value** from $H \rightarrow ZZ$ and $H \rightarrow \gamma\gamma$ (125 GeV).
- Introduce signal strength modifier μ_X for each production mode or decay channel.
- Apply **separate fit** for each production mode or decay channel.

Compatibility of Couplings the SM

- **Fix mass to best fit value** from $H \rightarrow ZZ$ and $H \rightarrow \gamma\gamma$ (125 GeV).
- Introduce signal strength modifier μ_X for each production mode or decay channel.
- Apply **separate fit** for each production mode or decay channel.

- Determine **couplings from production mode and decay channel**:

$gg \rightarrow H$ production:

$qq \rightarrow qqH$ production:

Decay to f or V :

● f : $\kappa_{Hff} = \frac{m_f}{v}$

● V : $\kappa_{HVV} = \frac{2m_V^2}{v}$

- Coupling to gluon can be f or effective $(^*)$.
- Coupling to γ can be effective or a mixture of $f + V$.

- Direct measurement not possible since κ_i appear in nominator and denominator of

$$BR_i = \frac{\kappa_i}{\Gamma_h} = \frac{\kappa_i}{\sum \kappa}$$

Narrow Width Approximation

- Assume $\Gamma_H \ll m_H$, which is well justified by $\Gamma_H = 4.04$ MeV and $m_H = 125$ GeV.
- Propagator: $\frac{1}{(q^2 - m^2 + m^2\Gamma^2)} \rightarrow \frac{\pi}{m\Gamma} \delta(q^2 - m^2)$ for $\Gamma \rightarrow 0$.

- i.e. put **propagating particle on shell**.

- Calculate cross section as $\sigma \times \text{BR}$.

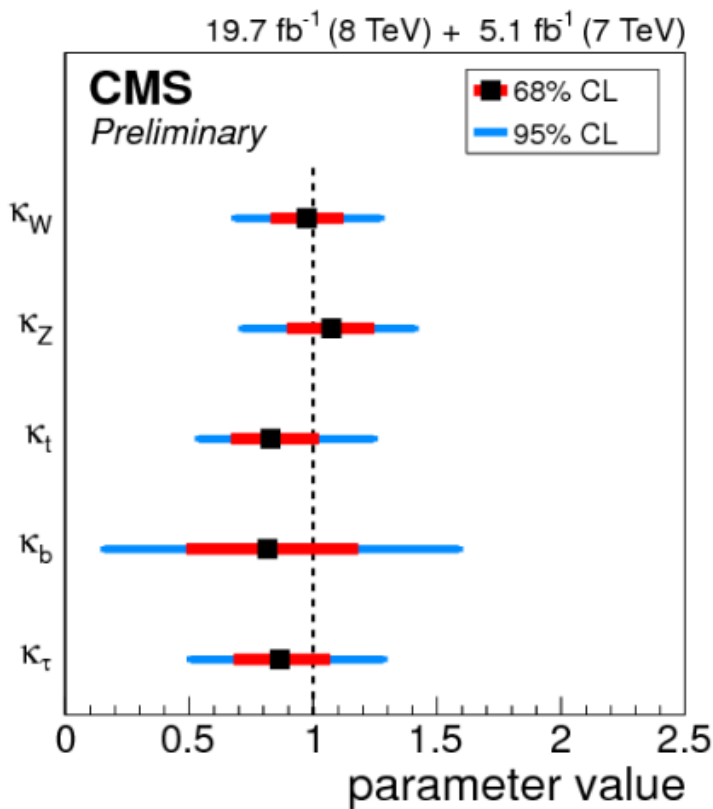

- $\text{BR}_X = \frac{\Gamma_X}{\Gamma_H}$, $\Gamma_H = \sum_i \Gamma_i$.

- $\sigma \propto (\kappa_t \kappa_\tau)^2 \propto (\kappa_u \kappa_d)^2 \propto (\kappa_q \kappa_f)^2 \propto (\kappa_g \kappa_f)^2$.

- For each production mode and decay channel **collect κ_i** and express Γ_H as **sum of individual κ_i** .

General Fitting model with 5 POI's

- **Five free parameters for each tree-level coupling**, m_H fixed to best fit value, κ_γ resolved in W , Z and t contributions, κ_g resolved in t and b contribution.

Fermion versus Vector Boson Couplings

- Cross section $H \rightarrow VV$:

$$\sigma \propto (\kappa_f \kappa_V)^2 + (\kappa_V \kappa_V)^2$$

\downarrow \downarrow
 $gg \rightarrow H$ $qq \rightarrow qqH$
- Cross section $H \rightarrow ff$:

$$\sigma \propto (\kappa_f \kappa_f)^2 + (\kappa_V \kappa_f)^2$$
- Cross section $H \rightarrow \gamma\gamma$:

$$\sigma \propto (\kappa_f^2 - \kappa_f \kappa_V)^2 + (\kappa_V \kappa_f - \kappa_V^2)^2$$
- $H \rightarrow \gamma\gamma$ **only channel to distinguish sign ambiguities** due to interference terms.

Custodial Symmetry

- In the SM an additional $SU(2)_L \times SU(2)_R$ symmetry protects κ_W & κ_Z to be the same (→ custodial symmetry).

Up-type versus Down-type Fermion Couplings

- In the SM fermion masses can be obtained via only one Higgs doublet field.
- In Two Higgs Doublet Models (2HDM) the coupling to *up-* and *down-type* fermions can differ significantly.

New Physics in Loops

- **New particles in loops** can lead to deviations of the effective couplings to gluons and photons from the SM expectation.
- Such deviations can be expressed by a **BR to new particles**, which have not been observed, yet.

- Assuming SM values for tree-level couplings.

Search for the Invisible

- Most model independent (inclusive) search for the decay, which has not been observed, yet, via deviation of $\sum \kappa_i$ from one.

Spin & Parity Estimates

- Spin and CP studies need something to make spin of particles visible → **spin analyzer**.
- Principle: **angular momentum conservation** in 2-body decay (best high energetic or with ν 's).
- Examples for $H \rightarrow ZZ \rightarrow 4\ell$:

$$Z : \quad P = -1$$

$$f : \quad P = +1$$

$$f : \quad P = -1$$

$$P = (-1)^L \prod_i (-1)$$

↳ Intrinsic parities

- Both **longitudinal and transverse polarization** states of Z bosons are Spin and Parity sensitive.

Spin & Parity Estimates

- Spin and CP studies need something to make spin of particles visible \rightarrow **spin analyzer**.
- Principle: **angular momentum conservation** in 2-body decay (best high energetic or with ν 's).
- Examples for $H \rightarrow ZZ \rightarrow 4\ell$:

$$Z : \quad P = -1$$

$$f : \quad P = +1$$

$$f : \quad P = -1$$

$$P = (-1)^L \prod_i (-1)$$

\rightarrow Intrinsic parities

- Both **longitudinal and transverse polarization** states of Z bosons are Spin and Parity sensitive.

Spin & Parity Estimates

- Principle: **angular momentum conservation** in 2-body decay (best high energetic or with ν 's).

- Examples for $H \rightarrow ZZ \rightarrow 4\ell$:

$$Z : P = -1$$

$$f : P = +1$$

$$f : P = -1$$

$$P = (-1)^L \prod_i (-1)$$

 Intrinsic parities

- Both **longitudinal and transverse polarization** states of Z bosons are Spin and Parity sensitive.

The $H \rightarrow ZZ$ System

- System described by m_{Z_1} , m_{Z_2} and five more variables:

θ_1 decay angle $Z_1 \rightarrow \ell\ell$

θ_2 decay angle $Z_2 \rightarrow \ell\ell$

θ^* decay angle $H \rightarrow ZZ$

Φ azimuthal angle $H \rightarrow ZZ$

Φ_1 azimuthal angle $Z_1 \rightarrow \ell\ell$

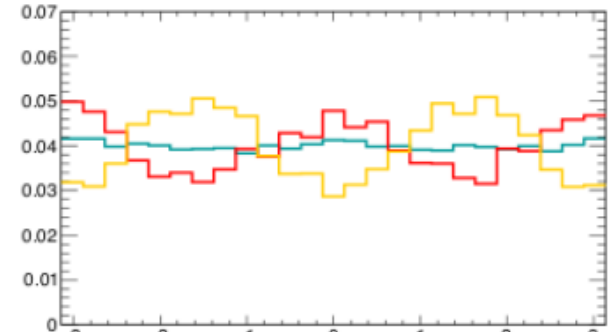

Discriminating Variables

$\cos \theta_1$

$\cos \theta_2$

Φ

$\cos \theta^*$

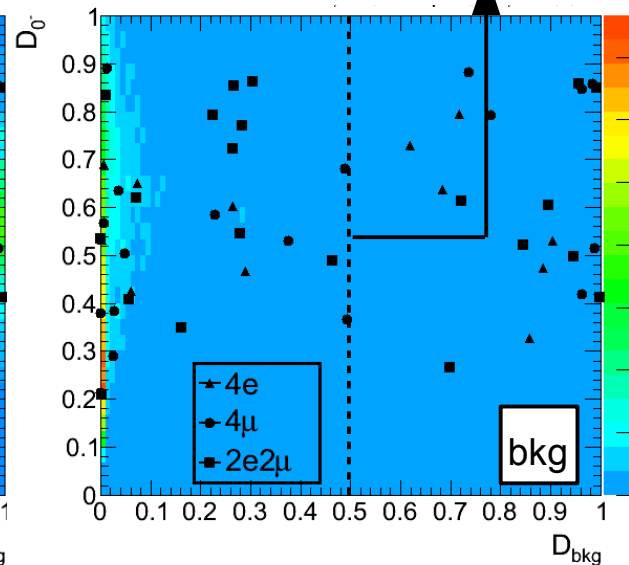

Φ_1

- As obtained from MC simulation (<http://www.pha.jhu.edu/spin/>).
- Taking acceptance and resolution effects into account.

Combination into a Single Discriminating Variable

- Events with $106 \text{ GeV} < m_{4\ell} < 141 \text{ GeV}$ (49 events).
- Example given for 0^- hypothesis.
- For 1d projection a cut has been applied of $D_{\text{bkg}} > 0.5$.
- Statistical **assessment based on hypothesis tests**.

Combination into a Single Discriminating Variable

- Test statistic: $q = -2 \ln \left(\frac{\mathcal{L}(0^+ + BG)}{\mathcal{L}(J^P + BG)} \right)$.
- Expectation for given hypothesis 0^+ or J^P obtained from toy experiments.
- SM hypothesis (0^+) tested against large number of alternative hypotheses. SM favored in each case.

Combination into a Single Discriminating Variable

- Test statistic: $q = -2 \ln \left(\frac{\mathcal{L}(0^+ + BG)}{\mathcal{L}(J^P + BG)} \right)$.
- Expectation for given hypothesis 0^+ or J^P obtained from toy experiments.
- SM hypothesis (0^+) tested against large number of alternative hypotheses. SM favored in each case.

0^+ hypothesis favored.

Combination into a Single Discriminating Variable

- Test statistic: $q = -2 \ln \left(\frac{\mathcal{L}(0^+ + BG)}{\mathcal{L}(J^P + BG)} \right)$.
- Expectation for given hypothesis 0^+ or J^P obtained from toy experiments.
- SM hypothesis (0^+) tested against large number of alternative hypotheses. SM favored in each case.

Spin 1 already excluded from $H \rightarrow \gamma\gamma$.

Combination into a Single Discriminating Variable

- Test statistic: $q = -2 \ln \left(\frac{\mathcal{L}(0^+ + BG)}{\mathcal{L}(J^P + BG)} \right)$.
- Expectation for given hypothesis 0^+ or J^P obtained from toy experiments.
- SM hypothesis (0^+) tested against large number of alternative hypotheses. SM favored in each case.

Implies anomalous coupling since no 0^- couplings at tree level in the SM.

Combination into a Single Discriminating Variable

- 0^- most interesting hypothesis, since predicted in many extensions of the SM (e.g. MSSM).
- Only realistic decay channel to study this hypothesis: $H \rightarrow \tau\tau$
- SM hypothesis (0^+) tested against large number of alternative hypotheses. SM favored in each case.

Implies anomalous coupling since no 0^- couplings at tree level in the SM.

Properties Summary

- New particle is a boson. ✓
- Mass: $m_H = 125.03 \pm_{0.27}^{0.26}$ (stat.) $\pm_{0.15}^{0.13}$ (syst.) GeV ✓
- Decay width: $\Gamma_H < 22$ MeV ✓
- Spin: 0 favored ✓
- Parity: +1 favored ✓
- CP: ???

- Remaining questions:
 - Is this **A** Higgs bosons?
 - Is this **THE** Higgs bosons?
 - Is there **MORE THAN ONE** Higgs bosons?
- Last lecture will be given by Günter Quast, I will be at CERN. Topics will be:
 - Search for **additional Higgs bosons** (**compulsory program**).
 - Search for additional Higgs bosons (**dedicated searches: $H \rightarrow \tau\tau$**).
 - Decay to invisible.
 - Other dedicated searches (?).
